
Firm-level means; window → filing → firm → tier, all unweighted. Bars are 95% percentile bootstrap CIs over 10,000 draws resampling firms within tier, seed 20261004. Failed windows are dropped, never imputed. SIMULATED truncation: every window was scored in isolation, so a persona scoring window 1 of 25 never saw the rest of the filing. This is not a model reading a truncated document; that is S1(b), not run here.
